

May 29, 2017

The necessity to migrate our legacy database of discontinued applications from a Sybase database to a SQL Server database forced us to look for an effective migration solution.

We chose Ispirer MnMTK 2015 and started the migration at the beginning of 2017. The database size was 22GB, with 1500 tables and more than 100.000 lines of code in SQL objects.

After three months, we have finished the project and we are very satisfied with the results. The tool itself was easy to install, with great usability and with a percentage conversion of objects very close to 100% - that the few uncovered items were identified by the tool with indication of how to proceed to achieve 100% success. It should be noted that the support (both pre- and post-sale), offered by Ispirer team, was comprehensive and perfect.

We certainly recommend Ispirer Systems and their powerful toolkit to anyone with the similar task.
